## Abstracts

The global Double Dry Gas Seals market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Composed of two sets of friction pairs, it forms a sealed chamber filled with pressurized nitrogen. During operation, a gas film of about 3 microns is formed between the friction pairs, enabling non-contact operation of the friction pairs, which prevents wear and heat generation. The principle of gas blocking is adopted. Adding gas with a pressure higher than the medium pressure to the sealed chamber can achieve zero leakage of the process medium. Only a trace amount of gas leaks into the environment. Nitrogen, which is environmentally friendly and safe, is used as the sealing gas.
