The global Double Flange Electromagnetic Clutch Brake market size is predicted to grow from US$ 909 million in 2025 to US$ 1449 million in 2031; it is expected to grow at a CAGR of 8.1% from 2025 to 2031.

The double flange electromagnetic clutch brake is a transmission device that combines electromagnetic clutch and electromagnetic braking functions. It is widely used in various mechanical equipment, especially in occasions that require efficient control of start-stop and braking. Its design adopts a double flange structure, which is usually connected by flanges at both ends, making it more stable and convenient during installation. This type of electromagnetic clutch controls the engagement and separation of the clutch through electromagnetic force. When current passes through, the electromagnetic force causes the clutch to engage, and the clutch to disengage after power failure, thereby realizing power switching; at the same time, it also has an electromagnetic braking function, which can automatically apply braking force when the current is interrupted to ensure the safe shutdown of the system. The double flange electromagnetic clutch brake has a strong load capacity and high working reliability. It is suitable for occasions that require high-frequency start-stop and large load changes, such as lifting equipment, conveying systems, automated production lines, etc. This type of clutch can usually withstand large impact loads and has a long service life.

United States market for Double Flange Electromagnetic Clutch Brake is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
