Double-head die bonder is a kind of equipment used to fix and package electronic components. It is commonly used in the semiconductor industry, especially during the packaging of integrated circuits (ICs). The double-head die bonder has two working heads, each with a thermal head and a cooling head. During the operation, the electronic components (such as chips, wafers, etc.) are first placed on the substrate (such as a PCB board), and then the substrate is placed on the workbench of the die bonder. Next, the working head applies heat, pressure and cooling simultaneously, firmly affixing the electronic components to the substrate. The thermal head is heated to a temperature that melts the solder or other bonding material and bonds the electronic

component to the substrate. The cooling head will quickly reduce the temperature, so that the solder or adhesive material can be solidified quickly, so as to ensure the firmness and stability of the fixing. The double-head die bonder has the characteristics of high precision and high efficiency, can realize the precise die bond process, and can handle multiple packaging tasks at the same time to improve production efficiency. It is widely used in the semiconductor packaging industry for the manufacture of various electronic devices and products such as mobile phones, computers, televisions, etc.
