Double Helix Mixers are widely used in chemical, pesticide, dye, food, feed, building materials, rare earth and other powder and powder (solid-liquid) mixing. The machine has wide adaptability to mixed materials, no overheating of heat-sensitive materials, no pressure feeding and grinding of granular materials, and no crumb segregation when mixing materials with different specific gravity and different particle sizes. A jacket can be added to the outside of the mixer barrel, and the material can be cooled or heated by injecting cold and hot medium into the jacket; the cooling is generally pumped into industrial water, and the heating can be passed into steam or electric heating heat transfer oil.
