The double planetary stirring pulping system is a kind of equipment dedicated to the pulping process. It is usually used for the process of mixing, stirring, dispersing and homogenizing solid particles and liquids in the slurry. This system usually consists of two planetary agitators, which can effectively stir and mix the slurry vigorously. In the dual planetary mixing and pulping system, solid particles and liquid can be fully mixed through the dual rotational motion of the agitator rotation and the rotation of the planetary shaft itself around the planetary axis to achieve the desired processing effect. This kind of system is usually widely used in pulp preparation, food processing, chemical production and other fields. Double planetary mixing and pulping systems usually have the advantages of high efficiency, uniform mixing, and simple operation, and can meet the pulping processes of different process requirements.

The global Double Planetary Mixing and Pulping System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
