The double-layer rotor scale is a device for precise quantitative feeding, usually used to process powdered or granular materials. Its main structural feature is the use of two independent rotors, each of which is responsible for the transportation of a part of the material, and the flow rate and feeding speed of the material are controlled by rotating the rotor. The double-layer rotor scale combines high-precision weighing sensors and control systems to achieve precise quantitative feeding, and is widely used in material handling and batching systems in the chemical, food, pharmaceutical and other industries. The equipment has the advantages of easy operation, high stability and high precision, and is suitable for production processes with strict requirements on material ratios.
