A double-row spherical roller bearing is a type of rolling-element bearing designed to accommodate high radial loads and moderate axial loads in both directions. It consists of two rows of barrel-shaped rollers with symmetrical raceways in the outer ring, and a common spherical raceway in the inner ring. This unique design allows the bearing to self-align and compensate for shaft misalignment or mounting errors, ensuring smooth operation even under dynamic and static misalignment conditions. Double-row spherical roller bearings are commonly used in heavy-duty applications such as industrial machinery, mining equipment, construction machinery, and conveyor systems, where high radial loads, shock loads, and misalignment are common. They offer excellent load-carrying capacity, high durability, and reliable performance in harsh operating environments. These bearings are available with various cage designs, including steel, brass, and polymer cages, to suit different application requirements and operating conditions. Overall, double-row spherical roller bearings are versatile and robust components that provide reliable support for rotating shafts and ensure smooth operation of machinery and equipment.

The global Double-row Spherical Roller Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
