The double-section full-servo robot is a high-performance removal device widely used in the field of injection molding automation. It adopts a vertical double-section structure (primary arm + secondary telescopic arm) and a multi-axis full-servo drive system. It has the remarkable characteristics of compact structure, high-speed movement, stable operation, and high repetition accuracy. This robot is precisely controlled by servo motors in multiple directions such as up and down, horizontal, and pulling. It can not only achieve fast removal, outside mold stacking, insert operation, and product flipping, but also flexibly set parameters such as path, speed, and delay through the human-machine interface (such as touch screen), and supports program storage, multi-task switching, and communication networking. The double-section structure can take into account both stroke and speed under conditions where the mold space is compact or the stroke requirement is large, making it have obvious advantages in high-beat, high-precision automated production lines. Compared with traditional pneumatic robots, full servo control can better meet the needs of modern industry.

United States market for Double-section Full Servo Manipulator is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
