The global Double-sided Carbon Clad Copper Foil market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Double-sided carbon-coated copper foil refers to a composite material where a layer of carbon material is coated or plated onto both the front and back surfaces of a copper foil. Typically, this involves applying a 1-3 micrometer (µm) thick layer of conductive carbon material onto both sides of a 9 µm thick copper substrate, resulting in a surface resistance of less than 30 ohms per 25 square micrometers. Double-sided carbon-coated copper foil exhibits enhanced physical properties such as superior conductivity and lower internal resistance. It also possesses good mechanical strength and toughness, preventing shorts caused by dendrite growth. Furthermore, it demonstrates better adhesion strength with electrode material coatings.

United States market for Double-sided Carbon Clad Copper Foil is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
