Doubly-fed air-cooled converter is a power electronic device commonly used in wind power generation systems. It is a frequency converter used to convert alternating current generated by wind turbines into alternating current at a stable grid standard frequency and transmit it to the grid. 'Double-fed' means that the rotor of a wind turbine can be excited by the power provided by the stator windings, or by the power provided by the rotor windings. This structure enables the wind turbine to provide higher output power at rated wind speed and improves the efficiency of the system. 'Air cooling' means that the doubly-fed air-cooled converter uses air-cooling to dissipate heat through fans or other air-cooling equipment instead of water-cooling. The doubly-fed air-cooled converter plays a vital role in the wind power generation system. It can

effectively control the speed of the wind turbine, improve the efficiency of the power generation system, and convert unstable wind energy into Stable electric energy is output to the power grid.
