The down fluffiness tester is a laboratory measuring instrument that reflects the fluffiness of down by measuring the volume occupied by a certain amount of samples in a container of a certain caliber under constant weight pressure. The down fluffiness tester meets almost all measurement standards both domestically and internationally, with a high degree of automation. It can automatically blow fluffiness, select pressure plates, release pressure plates, monitor down pressing status, monitor static state, and measure fluffiness according to different measurement standards. The down fluffiness tester mainly consists of a blowing device, a pressing plate selection device, a pressing plate release device, a pressing plate detection device, a fluffiness measurement device, a pressing plate level judgment device, etc. The blowing device automatically places the blowing disc on the measuring cylinder and achieves automatic blowing fluffiness; The pressure plate selection device automatically selects different specifications of pressure plates according to different standards; The pressure plate release device will automatically lower the pressure plate at the preset speed, automatically releasing the pressure plate; The down pressing detection device can automatically recognize the contact between the pressing plate and the down, and automatically detect the process of down pressing and resting; The fluffiness measuring device can automatically measure the fluffiness value after pressing; The pressure plate level judgment device can automatically determine whether the pressure plate is tilted after pressing.
