The down-conversion mixer consists of four NMOS switch tubes and a current-voltage converter without an op amp, and has the function of image suppression. The differential RF signals VRFP and VRFN amplified by the front-end low-noise amplifier (LNA) pass through the capacitor C1 And C2 are coupled to the source of the switching tube, the gates of the four switching tubes are respectively connected to the quadrature four-phase clock of the local oscillator signal, and the drains are paired with two wires to form an image suppression down-conversion mixer.
