Downhole Emulsion Breaker is a chemical used in oil well production. Its main function is to destroy the emulsification state in the oil-water emulsion and promote the separation of oil and water phases, thereby increasing the oil content and output of the oil well production fluid. In the process of oil field exploitation, water-bearing oil layers are often encountered, and oil-water emulsification is one of the common phenomena. Due to the emulsification of oil and water, the mixing volume of oil and water increases, resulting in a decrease in the oil content in the oil well production fluid and reducing the productivity of the oil well. Therefore, in order to improve the productivity of oil wells and the quality of produced fluid, it is necessary to use downhole demulsifiers to destroy the oil-water emulsification state and separate the oil-water phases.

The global Downhole Emulsion Breaker market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
