The global Drag Reducing Agent for Pipeline market size is predicted to grow from US\$ 1425 million in 2025 to US\$ 2562 million in 2031; it is expected to grow at a CAGR of 10.3% from 2025 to 2031.

Drag reducing agent (DRA) for pipelines, also known as flow improver or pipeline drag reducer, is a chemical additive used to reduce the frictional resistance (drag) between the flowing fluid and the internal walls of a pipeline. When added to the fluid, the DRA forms a thin, temporary layer on the pipeline's inner surface, which alters the fluid's flow characteristics and reduces turbulence. This leads to improved flow efficiency and reduced energy consumption in pipeline transportation systems.

The global market for drag reducing agents (DRAs) for pipelines has been witnessing steady growth over the years, primarily driven by the increasing demand for cost-efficient and energy-saving solutions in the transportation of hydrocarbon fluids through pipelines. DRAs play a significant role in enhancing the efficiency of pipeline operations, reducing pumping costs, and increasing the throughput capacity of existing pipeline infrastructure. The demand for drag reducing agents varies across different regions based on the level of pipeline infrastructure development and the focus on energy efficiency. North America and Europe have been significant markets for DRAs due to their well-established pipeline networks and regulatory incentives for energy conservation. The Asia-Pacific region has shown considerable growth potential due to increasing pipeline construction activities and the need for more efficient energy transportation. The market for drag reducing agents is expected to continue growing as pipeline operators seek innovative solutions to optimize pipeline operations, reduce operational costs, and improve environmental sustainability. Advancements in DRA technology, along with the expansion of oil and gas transportation infrastructure, are

likely to drive market growth in the coming years. Moreover, the increasing focus on sustainable practices and the adoption of advanced flow-enhancing technologies are anticipated to boost the demand for drag reducing agents globally.
