The global Drain Separator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A drain separator is a device that separates and eliminates condensate, which is water condensed from compressed air and steam after the air loses heat. It is also called a brackish water separator. Drain separators are used in air conditioning equipment and various industrial facilities.

There are two types of condensate separators: the in-line type, which is incorporated between the compressor and piping, and the trap type, which eliminates condensate flowing into the trap from branch pipes by attaching an obstruction plate or the like in the piping. The most famous in-line type of drain separator is the cyclone separator, which uses the centrifugal force of high-speed rotation to separate suspended condensate contained in the air, which is difficult to remove.

United States market for Drain Separator is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
