Drilling Fluid Desander is a piece of equipment that utilizes centrifugal force to separate larger solid particles such as sand from the drilling fluid. It consists of one or more cyclones. When the drilling fluid enters the cyclone under a certain pressure and flow rate, the centrifugal force generated causes the heavier sand particles to be thrown towards the wall of the cyclone and settle at the bottom for discharge, while the lighter liquid and fine particles are discharged from the top overflow pipe. This enables solid-liquid separation, maintaining the good performance of the drilling fluid and ensuring the smooth progress of the drilling process.
