## Abstracts

The global Drilling Fluid Desilter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Drilling fluid desilter is a three-level solid control device used in the drilling fluid solid phase control system. It is mainly composed of a vibrating screen, a diversion manifold, a cyclone, etc. The working principle of the drilling fluid desilter is to separate and remove solid particles in the drilling fluid by using the particle sedimentation principle. During drilling operations, the drilling fluid generates a certain pressure and speed through the sand pump and spirals into the desilter along the inner wall of the cyclone. Under the action of centrifugal force and gravity, the coarser particles spiral down along the inner wall of the cyclone and are discharged from the bottom flow port; while the finer particles spiral up along the cyclone, and after further screening and separation by the vibrating screen, clean drilling fluid is finally obtained. The drilling fluid desilter has the advantages of low noise, long screen life, strong processing capacity and good separation effect. It is widely used in drilling operations in the oil, natural gas and other industries, and is of great significance for improving drilling efficiency, reducing drilling costs and ensuring drilling safety.

United States market for Drilling Fluid Desilter is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
