Drilling Fluid Shale Shaker is a primary solid control equipment in the drilling fluid solid control system. It is mainly used to separate large solid particles (usually larger than 74  $\mu$ m) from the drilling fluid. Its working principle is to drive the screen to move through the vibration motor, so that when the drilling fluid flows through the screen, the larger solid particles are retained and discharged by the screen, while the finer drilling fluid and small solid particles pass through the screen and continue to circulate. It is usually installed above the drilling fluid tank and is the first process of drilling fluid treatment. It can effectively reduce the solid content in the drilling fluid and play a protective and auxiliary role for subsequent solid control equipment (such as centrifuges, etc.).
