## Abstracts

The global Drilling Grade Polyanionic Cellulose market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Drilling Grade Polyanionic Cellulose (PAC) is a type of water-soluble polymer that is commonly used as a drilling fluid additive in the oil and gas industry. It is derived from cellulose and is chemically modified to have anionic groups that impart unique properties such as high viscosity, fluid loss control, and shale inhibition. These properties make it an effective additive for drilling muds, which are used to lubricate and cool drilling bits, control formation pressures, and carry drilled cuttings to the surface. Drilling Grade PAC is available in various grades and viscosities, depending on the specific application requirements.

The market for drilling grade polyanionic cellulose is driven by the demand for efficient and stable drilling fluids in the oil and gas industry. Drilling grade PAC acts as a viscosifier, fluid loss reducer, and shale stabilizer in drilling fluids, helping to maintain wellbore stability and improve drilling efficiency. It provides advantages like thermal stability, excellent water retention, and shear-thinning behavior. The market growth is influenced by the continuous need for efficient and reliable drilling fluid additives. The demand for high-quality and performance-oriented drilling grade polyanionic cellulose contributes to the growth of this market.
