Water treatment technologies are organized into three general areas: physical methods, chemical methods, and energy intensive methods.

Chemical methods of treatment rely upon the chemical interactions of the contaminants we wish to remove from water, and the application of chemicals that either aid in the separation of contaminants from water, or assist in the destruction or neutralization of harmful effects associated with contaminants. Chemical treatment methods are applied both as stand-alone technologies and as an integral part of the treatment process with physical methods.

Water consumption is consistently increasing with rapid urbanization and economic development in emerging countries. Water quality relies on various parameters such as hardness, pH, TDS (Total Dissolved Solids), and alkalinity. Water treatment chemicals are used to eliminate water impurities. These chemicals are also used to treat municipal water including cleaning and drinking water. The industrial sector needs water for washing, cooling, and processing.
