Clean drinking water is considered to be one of the implicit requirements for a healthy human population. However, the increase in industrialization and rising use of chemicals has created a burden of unwanted pollutants in the drinking water. Therefore, several effective purifying technologies are developed to maintain the quality of water. Amongst these, an immensely beneficial procedure is used for purification of water with the help of 'adsorbents'. Adsorbents are obtained from alumina, zeolite, carbon, clay minerals, industrial by-products, and natural products such as parts of the plants and others.
