Drone batteries are essential for powering drones and allowing them to fly. The type of battery used in a drone can vary depending on the size and model of the drone. Some common types of drone batteries include lithium polymer (LiPo) batteries, lithium-ion batteries, and nickel-metal hydride (NiMH) batteries. LiPo batteries are the most commonly used type of battery for drones due to their high energy density and lightweight design. These batteries are known for providing high power output and long flight times. However, they require careful handling and charging to prevent damage or overheating. Lithium-ion batteries are another popular choice for drone batteries. They are more stable and have a longer lifespan compared to LiPo batteries. However, they are heavier and have a lower energy density, which can result in shorter flight times. NiMH batteries are less commonly used in drones but are still an option for some models. They are known for their stability and reliability but have a lower energy density compared to LiPo and lithium-ion batteries. When choosing a drone battery, it is important to consider factors such as voltage, capacity, and discharge rate to ensure optimal performance and flight time.

The global Drone Batteries and Power market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
