The droplet microfluidics system is a technology platform that uses microscale channels to precisely control the formation, manipulation and processing of single microdroplets of immiscible liquids (such as water and oil). By adjusting the flow rate, interfacial tension and channel structure in the microfluidic chip, the system can generate droplets of consistent size in a high-throughput and reproducible manner, which can be used as independent reaction microreactors and are widely used in single-cell analysis, high-throughput screening, drug delivery, synthetic biology and diagnostic testing.
