A radiosonde is a battery-powered telemetry instrument carried into the atmosphere usually by a weather balloon that measures various atmospheric parameters and transmits them by radio to a ground receiver. Modern radiosondes measure or calculate the following variables: altitude, pressure, temperature, relative humidity, wind (both wind speed and wind direction), cosmic ray readings at high altitude and geographical position (latitude/longitude). Radiosondes measuring ozone concentration are known as ozonesondes.

Radiosondes are battery-powered telemetry instrument packages that are carried into the atmosphere typically by a weather balloon; they measure altitude, pressure, temperature, relative humidity, wind (both speed and direction), and cosmic ray readings at high altitudes. A class of radiosonde whose position is tracked as it ascends in the atmosphere to give wind speed and direction is referred to as rawindsonde, which is an abbreviation for radar wind sonde. Another class of radiosondes are the ones that are released from airplanes and fall rather than being carried by weather balloons. This class of radiosondes are referred to as dropsondes. Radiosondes play a vital part in most forms of operational atmospheric data assimilation.
