Droxidopa is a prodrug of norepinephrine used to increase the concentrations of these neurotransmitters in the body and brain. It is metabolized by aromatic L-amino acid decarboxylase (AAAD), also known as DOPA decarboxylase (DDC). Patients with NOH have depleted levels of norepinephrine which leads to decreased blood pressure or hypotension upon orthostatic challenge.[6] Droxidopa works by increasing the levels of norepinephrine in the peripheral nervous system (PNS), thus enabling the body to maintain blood flow upon and while standing. Droxidopa can also cross the blood–brain barrier (BBB) where it is converted to norepinephrine from within the brain. Increased levels of norepinephrine in the central nervous system (CNS) may be beneficial to patients in a wide range of indications. Droxidopa can be coupled with a peripheral aromatic L-amino acid decarboxylase inhibitor (AAADI) or DOPA decarboxylase inhibitor (DDC) such as carbidopa (Lodosyn) to increase central norepinephrine concentrations while minimizing increases of peripheral levels.

LPI (LP Information)' newest research report, the “Droxidopa Industry Forecast” looks at past sales and reviews total world Droxidopa sales in 2022, providing a comprehensive analysis by region and market sector of projected Droxidopa sales for 2023 through 2029.
