Drug eluting bead is a therapy for the treatment of hypervascularized tumours. Drug eluting bead allows for embolization and local release of chemotherapy in the treatment of hepatic malignancy through the intra-arterial delivery of microscopes. Drug eluting bead provides an alternative therapeutic option in unresectable tumours. Drug eluting beads are widely used in primary and liver dominant metastatic disease of the liver. Drug eluting beads improves the safety and efficacy of transarterial chemoembolization (TACE) in hepatocellular carcinoma (HCC). The drug eluting bead is given through the catheter directly to the liver tumor. Giving chemotherapy with the bead is more beneficial, as the chemotherapy is gradually released from the beads. Slowly released chemotherapy from the bead destroys the tumor over a greater period of time. Drug eluting beads are new embolic agents that allows the continuous release of chemotherapeutic agents.

The global pharmaceutical market is 1475 billion USD in 2022, growing at a CAGR of 5% during the next six years. The pharmaceutical market includes chemical drugs and biological drugs.
