The global Drug Safety and Pharmacovigilance (PV) Software market size is predicted to grow from US\$ 275 million in 2025 to US\$ 398 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

Drug Safety and Pharmacovigilance (PV) Software is an automated, information-based tool used by pharmaceutical companies, healthcare institutions, and regulatory authorities to monitor, assess, and prevent adverse drug reactions (ADRs) and safety risks throughout the entire drug lifecycle. It ensures drug compliance, aims to protect public health, improve patient safety, and meet the legal obligations of marketing authorization holders (MAHs).

As global drug regulatory agencies (such as the FDA, EMA, and NMPA) continue to tighten post-marketing regulatory requirements, the traditional manual review-based Individual Case Safety Report (ICSR) processing model can no longer cope with the explosive growth of massive amounts of data. Current leading opinions emphasize that by 2026, the core competitiveness of the market will focus on the full-stack integration capability of AI, that is, whether software can automate the entire process from scanning original documents and automatically sorting cases to providing scientific writing suggestions through large language models and natural language processing. This transformation makes pharmacovigilance software no longer just a database tool, but an indispensable 'risk warning center' in pharmaceutical companies' R&D decision-making.
