Drum brake linings are critical components within the drum brake system, crafted from a specific friction material designed to engage with the interior surface of the brake drum to slow down or stop the rotation of the wheel when the brake is applied by the driver. These linings are typically shaped to conform to the drum's contours to maximize contact area and ensure even friction distribution. Their performance is primarily determined by their friction coefficient and wear resistance, both of which dictate the efficiency and durability of the linings over multiple uses.
