Dry Air Classifier is a commonly used particle material classification equipment. Its main principle is to use air flow to separate and classify particles. Dry airflow classifier usually consists of feeding system, airflow system, classification device and discharge system. During operation, granular materials are introduced into the air flow through the feeding system, and through the action of the air flow, the particles are separated in the classification device. Dry airflow classifier has the advantages of large processing capacity, good classification effect, and easy operation. It is widely used in mining, building materials, chemical industry, food, pharmaceutical and other fields to classify, separate and screen granular materials.

Currently, the typical models of Dry Air Classifier include Sturtevant's Whirlwind and SuperFine, etc.
