The global Dry Ambient Air Coolers market size is predicted to grow from US\$ 1219 million in 2025 to US\$ 1661 million in 2031; it is expected to grow at a CAGR of 5.3% from 2025 to 2031.

Dry ambient air coolers are heat-transfer devices that use air to remove excess heat into the atmosphere. Usually, a dry cooler presents a heat exchanger (it can be either microchannel coils or a finned tube) and fans.

Globally, there is a growing demand for energy-saving, low-consumption, and environmentally-friendly cooling equipment. The air cooler works on the principle of evaporation. It employs a primary airflow mechanism that draws in fresh air from the outside and sends it across wet cooling pads that absorb heat from the environment instead of drying it out like an air conditioner. In addition, this air cooler does not use any toxic coolants such as CFC, HCFC or other hydrofluorocarbons commonly used in air conditioners to cool the environment, which is more environmentally friendly. As consumers become increasingly concerned about air conditioner energy use, they are turning to air coolers. They save nearly 80% to 90% on electricity bills compared to air conditioners, making them more cost-effective and energy-efficient in the long run. However, consumers are hesitant to use air coolers because they take up space and do not match the decor of the room. However, many manufacturers have realized that this is a big problem and are developing smaller, sleeker, more elegant air coolers. Also, manufacturers are innovating to make them more efficient so that they can be used in large rooms and can be easily moved with the help of casters. In addition, the ease of installation and portability of air coolers is also driving the growth in demand. Air coolers

are 80% to 85% cheaper than air conditioners, making them more accessible and adaptable to the world's growing middle class. On the other hand, product innovations are increasing the demand in developing economies. A key factor driving the growth of this market is cooling efficiently and economically while using less energy. Air coolers that do not use the toxic cooling compounds used in air conditioners to cool the surrounding environment, making them more environmentally friendly, is another growing factor. Increasing demand for energy efficient, low power consumption, and highly flexible devices is also driving the air cooler industry.
