A dry bearing is a type of bearing that does not require lubrication to function properly. Instead of using oil or grease for lubrication, dry bearings are typically made from self-lubricating materials such as bronze, graphite, or plastic. Dry bearings are commonly used in applications where traditional lubrication methods are not practical or where contamination from lubricants is a concern. They are known for their low maintenance requirements and resistance to wear and corrosion.

The global Dry Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
