The global Dry Claw Vacuum Pumps market size is predicted to grow from US\$ 323 million in 2025 to US\$ 438 million in 2031; it is expected to grow at a CAGR of 5.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The dry claw vacuum pump uses positive displacement by trapping the gas and moving it through the pump which creates pressure. A claw vacuum pump is approximately 30% more efficient than a comparable rotary vane pump and the claw pump uses less energy. Because the claw pump runs dry and doesn't use any oil, it can run hot. However, this can be viewed as an advantage because it helps reduce condensation of pumped vapors and contamination. Because of the higher operating temperature, the dry claw vacuum pump can typically accept higher temperature gases that would normally condense at lower operating temperatures. For that same reason, the dry claw pump also has positive water vapor pumping characteristics as well. It's important to keep in mind that the higher operating temperatures could potentially require the pump bearings and seals to be purged in order to prevent heat related failure.

United States market for Dry Claw Vacuum Pumps is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
