The global Dry Film Photoresist Stripper Solution market size is predicted to grow from US\$ 952 million in 2025 to US\$ 1183 million in 2032; it is expected to grow at a CAGR of 3.2% from 2026 to 2032.

Dry film photoresist stripper solution apply to remove Dry Film Photo resist from most alkaline processed resists. Dry film photoresists have become the most widely used plating and etching resists for photochemical machining operations. They are classified into solvent, semi-aqueous and full aqueous resists, based on the type of chemistry required to place the resist. Solvent resists use chlorinated solvents for both developing and stripping. Semi-aqueous resists are developed in a solution of weak alkali and water miscible solvent. Full aqueous resists are usually developed with weak alkali alone. They can be stripped in hot alkali, but performance of alkali-only strippers is barely adequate for many production operations. Demands for higher strip rates and loading force many users of aqueous resist to use a semi-aqueous stripper: either a homebrew solution of a glycol ether and caustic or a proprietary blend of chemicals.

Some of the market drivers for dry film photoresist and its stripper solution are the increasing demand for advanced electronic devices with higher functionality and performance, the adoption of nanotechnology and microfabrication techniques, and the development of new package substrates with different structures.

Some of the constraints of dry film photoresist and its stripper solution are the difficulty in removing high-resolution and crosslinked dry film, the corrosion and damage to various materials and components during stripping, the environmental and safety issues related to amine-based strippers, and the competition from other photolithography technologies such as liquid photoresist.

Some of the future opportunities for dry film photoresist and its stripper solution are the development of next-generation dry film products with improved resolution, adhesion, and chemical resistance, the application of direct imaging exposure machines for advanced IC substrate fabrication, the innovation of anime-free strippers with lower toxicity and waste water load, and the expansion of new markets such as millimeter-wave waveguide components and terahertz devices.
