A dry ice cleaning machine is a device that blows dry ice onto the surface of the object to be cleaned. The dry ice is crushed into a powder form and compressed air is used to blow it onto metal surfaces and other adhering surfaces. The sudden drop in surface temperature causes thermal contraction, which weakens the adhesive strength of the adherend, and the evaporation of the dry ice causes the volume between the surface and the adherend to expand 750 times, enabling the adherend to be peeled off.

A compressor is connected to the cleaning machine via a hose, and powdered dry ice is sprayed from a special air hose. At this time, safety protective equipment such as safety glasses, earplugs, leather gloves, and long-sleeved shirts are worn, and work is performed with adequate ventilation to prevent oxygen deficiency and carbon dioxide poisoning.

The global Dry Ice Washer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
