The global Dry Mouth Spray market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Dry Mouth Spray refers to a medication or oral product that is designed to provide relief from the symptoms of dry mouth, also known as xerostomia. It typically comes in a spray bottle or dispenser and is applied directly into the mouth. Here is a detailed definition:

The primary purpose of a dry mouth spray is to alleviate the discomfort and symptoms associated with a dry mouth. It helps by providing moisture and lubrication to the oral cavity, which can temporarily relieve symptoms such as dryness, soreness, difficulty in speaking or swallowing, and an increased risk of dental issues. Dry mouth sprays usually contain ingredients that help to moisturize and hydrate the mouth, such as water, glycerin, xylitol, saliva substitutes, or artificial saliva. Some sprays may also contain additional ingredients like natural or artificial flavoring agents to improve taste. Dry mouth sprays are typically sprayed directly into the mouth, targeting the affected areas. Users may spray the product onto the tongue, inner cheeks, and other parts of the oral cavity as needed throughout the day to maintain oral moisture and relief from dry mouth symptoms.

Dry mouth sprays are often designed to be portable and convenient to carry, allowing individuals to use them whenever needed, especially during activities where immediate relief may be required, such as during meals or while speaking.

Dry mouth sprays are generally safe to use and can be used by individuals experiencing dry mouth due to various causes, including side effects of medications, medical conditions, radiation therapy, or other factors that result in reduced saliva production.
