A dry objective lens is a type of objective lens used in optical microscopes and other optical instruments. Unlike immersion objective lenses that require a liquid medium (such as oil or water) between the lens and the specimen to improve the resolution and light-gathering ability, a dry objective lens operates in air. It is designed to focus light from the specimen onto the detector or the observer's eye without the need for an immersion medium. Dry objective lenses are commonly available in different magnification powers and numerical apertures, and they are widely used in various fields such as biology, materials science, and quality control for observing and analyzing specimens.

United States market for Dry Objective Lens is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
