Dry offset printing is a popular method of printing on plastic pails and other cylindrical or conical-shaped objects. Dry offset, also called Letterpress, or Indirect Relief Printing, is a printing process combining the characteristics of letterpress and offset. A special plate prints directly onto the blanket of an offset press, and the blanket then offsets the image onto the paper. The process is called dry offset because the plate is not dampened as it would be in the offset lithography process. This technology usually uses a special plate and ink system to ensure that no water is used during the printing process.

The global Dry Offset Printing market size is projected to grow from US\$ 167 million in 2024 to US\$ 262 million in 2030; it is expected to grow at a CAGR of 7.8% from 2024 to 2030.
