Abstracts

The global Dry Powder Electromagnetic Separator market size is predicted to grow from US\$ 102 million in 2025 to US\$ 176 million in 2032; it is expected to grow at a CAGR of 8.1% from 2026 to 2032.

In 2025, global sales of dry powder electromagnetic separator reached approximately 4,550 units, with an average ex-factory price of about US\$23,000 per unit. Major manufacturers recorded gross margins of approximately 28%–40%.

A dry powder electromagnetic separator is a powder purification device that uses an electromagnetic coil to generate a controllable magnetic field and employs rod-shaped, corrugated, or mesh-type magnetic matrices to create a high-gradient magnetic field. It is designed to capture iron powder, iron filings, equipment-wear particles, and certain weakly magnetic iron-bearing contaminants from dry powders and fine granular materials. The material passes through the magnetized matrix under gravity or vibration. Non-magnetic material is discharged normally, while magnetic contaminants are retained on the matrix. Once the preset contaminant-loading level is reached, feeding is stopped, the coil is de-energized to demagnetize the matrix, and the captured impurities are discharged by vibration or airflow. The HCT series manufactured by Huate, for example, integrates an excitation coil, specialized magnetic matrix, vibration system, and automatic diverter valve to complete a cyclic process of feeding and iron removal, power-off demagnetization, impurity discharge, and system reset.

Commercial systems generally comprise an electromagnetic coil, iron-core magnetic circuit, magnetic matrix, feeding and vibration mechanisms, cooling system, iron discharge mechanism, and electrical control system. Key technical parameters include background magnetic field strength, magnetic field strength at the matrix surface,

processing capacity, excitation power, cooling method, and degree of iron-discharge automation. These systems are primarily used for dry materials requiring stringent control of iron contamination, including lithium-ion battery cathode and anode materials, graphite, high-purity quartz, electronic ceramic powder, alumina, zirconia, pigment, chemical powder, food ingredient, and pharmaceutical powder.

United States market for Dry Powder Electromagnetic Separator is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
