A dry vacuum pump is a device used to extract gas or liquid, and is widely used in the field of vacuum technology. It extracts gas or liquid through the centrifugal force generated by a rotating mechanical device. Specifically, a dry vacuum pump uses the centrifugal force of a rotating rotor to suck gas or liquid from the inlet and then discharge it through the exhaust port to form a vacuum environment.

A dry vacuum pump is usually composed of a drive device, a rotating device, and a pump chamber. The drive device is usually an electric motor, which is used to provide energy to drive the movement of the rotating device. The rotating device is usually a rotating shaft and an impeller, which generates high-speed centrifugal force through rotating motion. The pump chamber is the main working part of the dry vacuum pump, and the gas or liquid is extracted from the pump chamber under the action of centrifugal force.

A vacuum oil pump is a pump device that uses mechanical force and the lubrication and sealing properties of oil to extract air or gas, thereby creating a vacuum state in a closed space. It uses oil seals and oil lubrication to reduce friction, improve pump efficiency, and extend service life.
