However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Dry Water Floor Heating. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Dry Water Floor Heating market.

Dry floor heating is a thin floor heating that is laid dry using prefabricated trench insulation modules and does not require cement backfilling. The metal heat uniformity layer is used as the ground radiator, allowing the low-temperature heat medium to evenly heat the ground, and supply heat to the room through radiation and convection, achieving the purpose of faster and comfortable heating. Dry floor heating increases the insulation thickness and heat equalization speed, effectively reduces downward heat transfer loss and improves ease of use. It is the most energy-saving, thin and efficient floor heating. Floors or floor tiles can be laid on the surface. According to the heating medium, it is divided into two categories: dry water floor heating and dry electric floor heating. Because of its thin thickness and fast heating, it can save energy. It is suitable for intermittent heating occasions with low entry threshold, high temperature

requirements and energy saving.
