The global Dual-Axis Semi-Automatic Dicing Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The biaxial semi-automatic dicing machine is a device that uses two high-speed rotating blades to cut wafers, which can achieve a high-precision and high-efficiency cutting process. The characteristic of the biaxial semi-automatic dicing machine is that it can cut the wafer in two directions at the same time, improving cutting efficiency and yield rate. Appropriate blades and cutting parameters can be selected according to different materials and process requirements to ensure cutting quality and stability. The distance between the blade and the wafer can be automatically measured and adjusted through a non-contact height measurement unit to avoid blade wear and wafer damage. Knife marks and straightening results can be quickly checked through a dedicated microscope to improve cutting accuracy and consistency. Automated control systems can be used to automate wafer positioning, alignment, cutting, cleaning and other processes, reducing manual intervention and errors. The biaxial semi-automatic dicing machine is mainly suitable for dicing silicon, quartz, glass, sapphire, alumina, iron oxide, gallium arsenide, lithium niobate and other materials. It can be used for integrated circuits QFN, piezoelectric ceramics, light-emitting diodes, separation devices, optical communication devices, LED chips, thermistors, optical devices, ceramic circuit devices and other fields.
