## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The dual-axis inclination sensor directly measures the acceleration of the object to be measured, and obtains the linear velocity of the object through an integral operation, and then further obtains the displacement of the object. Fundamentally speaking, the inclination sensor is still an inertial sensor, which follows the law of inertia of object motion and the integral calculation method. The dual-axis sensor is designed based on this basic principle, and there are other measurement principles and measurement methods.
