The global Dual Crystal Probe market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Dual Crystal Probe is a combination of two single probes, one for transmitting and one for receiving. The transmitted electrical pulse does not enter the receiving circuit, so it is not affected by blocking of the flaw detection instrument amplifier, and can detect near surface defects. Both the transmitting and receiving probes have their own delay blocks, and the incidence plane of the two delay blocks has a dip Angle, and the dip Angle depends on the depth of the detection area from the detection plane.

United States market for Dual Crystal Probe is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
