The global Dual Element Transducer market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

The range of applications for dual element transducers is expanding beyond traditional areas such as flaw detection and thickness measurement to other industries like petroleum and oil&gas, with the emerging technology of second-generation guided wave ultrasonic techniques.

A dual element transducer is a type of ultrasonic transducer that contains two piezoelectric elements. These elements are usually arranged in a single housing, with one element emitting an ultrasonic pulse and the other receiving the echo. Dual element transducers are commonly used in non-destructive testing (NDT) applications. They are used to inspect the entire thickness of a material, as each element allows for a different angle of inspection. The first element generates a short ultrasonic pulse that is reflected by internal defects, and the second element receives the reflected pulse.
