In 2025, the global production capacity of dual-motor e-axle drive unit was approximately 1,155.56 k units.

Dual-motor E-Axle Drive Units are integrated electric drive assemblies that combine two electric motors with reduction gears, inverters, differential structures, control units, and axle housings. They are mainly used in electric vehicles requiring higher torque output, four-wheel drive performance, redundancy, or improved power distribution. Compared with single-motor drive units, dual-motor systems can provide stronger acceleration, better traction control, and improved energy management under different driving conditions. They are widely adopted in high-performance electric cars, SUVs, light commercial vehicles, and specialized electric platforms requiring compact integration and high power density.

The industrial chain of Dual-motor E-Axle Drive Units covers upstream motor laminations, magnets, copper windings, bearings, gears, power semiconductors, controllers, sensors, housings, and cooling components. The midstream includes motor manufacturing, inverter integration, gear machining, assembly, calibration, software

control, NVH optimization, and reliability testing. Downstream applications mainly include passenger electric vehicles, electric SUVs, light commercial vehicles, performance electric vehicles, off-road electric platforms, and specialized electric mobility systems. Related services include design validation, vehicle matching, thermal management optimization, software updates, maintenance support, and performance calibration for different vehicle platforms.
