Dual pot sand filter is a filtration system used in various industries, including oil and gas, to remove solid particles, such as sand, from fluid streams. The dual pot sand filter typically consists of two filter vessels that operate alternately to ensure continuous filtration. When one vessel is in operation, the other is in the regeneration or backwash cycle. The fluid containing solid particles enters the active vessel, and the particles are trapped by the filter media, allowing clean fluid to pass through. The dual pot sand filter is commonly used to protect downstream equipment, such as pumps and pipelines, from abrasive particles, ensuring the smooth operation and reliability of the system.
