The global Dual-spectrum Online Monitoring IR Thermal Imagers market size is predicted to grow from US\$ 1196 million in 2025 to US\$ 1658 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

The dual-spectrum online monitoring IR thermal imager is a monitoring device that combines infrared thermography technology and visible light imaging technology. It is capable of simultaneously capturing both the infrared thermal image and the visible light image of the target object. By fusing image information from these two different spectral ranges, it provides more comprehensive and accurate target monitoring data. The infrared thermography component, primarily based on the infrared radiation emitted by the object itself, can detect the temperature distribution on the object's surface. Meanwhile, the visible light imaging component captures details such as the target's appearance, color, and texture. These two types of images complement each other, enhancing the detection, recognition, and analysis capabilities for the target.
