## Abstracts

The global Dual Track Dispensing Machine market size is predicted to grow from US\$ 380 million in 2025 to US\$ 523 million in 2031; it is expected to grow at a CAGR of 5.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The dual-track dispensing machine is an automated dispensing device equipped with two parallel and spaced conveying tracks, which realizes dual-station synchronous operation by independently transmitting the carrier. Its core design includes a vertically set magazine loading mechanism, which can complete the magazine clamping, material distribution and linear push of the carrier to the conveying track, and realize the vertical lifting and horizontal displacement of the carrier between the plug-in space and the track through the lifting component and the material shifting component, and finally position the carrier to the dispensing platform for precision processing. The equipment adopts a PLC control system and a servo motor to drive the ball screw, which can program the three-dimensional/four-dimensional path dispensing parameters, support AB glue automatic ratio and vacuum infusion system, and ensure  $\pm 0.01\text{mm}$  dispensing accuracy in electronic packaging, automotive parts gluing and other scenarios. The dual-track architecture shortens the loading and unloading time by 50% through alternating operations, and cooperates with the SD card storage function to realize the rapid synchronization of multi-machine process parameters. It is suitable for high-capacity demand scenarios such as smart terminal shell bonding and LED module potting.
