The duplex hydraulic filter is a parallel filtration device for hydraulic systems. It consists of two independent filter elements that can work alternately or synchronously to ensure uninterrupted operation of the system when the filter element is replaced. Its core function is to remove particulate contaminants (such as metal chips and dust) in the hydraulic oil and protect precision components such as pumps and valves. It is suitable for high-load scenarios such as construction machinery and metallurgical equipment. The blockage status is monitored through a differential pressure indicator or electronic sensor, and online switching maintenance is supported, which significantly improves system reliability.
