Dural Substitutes are materials used to replace or repair meninges. The meninges are thin layers of tissue covering the surface of the brain and spinal cord, protecting them. In some brain surgeries, the meninges need to be incised or removed to provide adequate visibility and access for the surgical procedure. Meningeal substitutes can replace the original meninges during these surgeries to provide protection and support.

Common meningeal substitute materials include biological materials, synthetic materials, or a combination thereof. Biological materials usually come from human or animal tissue, such as artificial skin or animal membranes. Synthetic materials can be polymers, artificial membranes, or other specialty materials. The choice of meningeal substitute depends on surgical needs, patient condition, and the physician's personal preference.

Sealing Products are a type of product used to seal defects or incisions created during surgery. During brain surgery, sealing products may be needed to seal incisions and prevent fluid leakage or blood vessel rupture. These products are typically airtight, biocompatible, and tolerant to ensure safety and healing of the surgical site. Common brain surgery closure products include sutures, glue, etc. They are selected and applied based on specific surgical needs and material properties.
